Web application

- + The current web-based digital channel started operating in 2016.
- + It was designed and launched to automate the complete client order-to-purchase cycle and reduce the need for human client service agents in the corporate call center.
- + Clients have been categorized as Browsers, Selectors, Quote-only, and Buyers, with Buyer being the desired final status for every client interaction within the web system.
- + These classifications are used as metrics to evaluate the web system's effectiveness. The database contains nationwide data. A simplified graphic that illustrates the order-to-purchase process within the web system is presented in the following slide.

Web application

Web application

+ Clients are classified as follows:

- ❑ **'Browser'**: Clients who log in to the system to browse the catalog but do not make product selections.
- ❑ **'Selector'**: Clients who make some product selections to check availability and inventory but do not confirm orders.
- ❑ **'Quote-only'**: Clients who select products and request a quote, moving the prospective order to the cart with displayed prices. Negotiations may be initiated, and the order can transition to a person-attended one.
- ❑ **'Buyer'**: Clients who confirm their orders, establish payment methods, and choose between pick-up or delivery.
- ❑ **NOTE**: The classification of clients has been determined based on their most frequent type of interaction with the platform: browsing, selecting, quoting, or purchasing.
